

Wi-Fi & Airports

Wi-Fi and other unlicensed technologies have transformed modern travel. But Wi-Fi does more than keep us entertained at our gate or on a long flight – it's critical to the functioning of airports. That's why it is vital we have enough unlicensed spectrum to continue powering these technologies.

Travelers depend on Wi-Fi to **stay connected** to work and family, track flight information and navigate airports with connected apps and services.

Airlines are upgrading their on-board Wi-Fi systems to connect faster to **medical experts on the ground** for in-flight health emergencies.

Gate agents use Wi-Fi enabled scanners and tablets to **check in passengers** and ensure everyone makes it onto their flights.

Airlines use Wi-Fi for **baggage reconciliation**, both outside on the ramp and at the baggage claim.

Pilots and operations personnel use Wi-Fi-connected notebooks for **airfield inspections and condition reports**.
